

# Ranking Bad: The Chemistry of Ranked-Choice Voting

Michael Cowan

## Introduction

We assess the extent to which support for candidates varies across racial and ethnic lines in a hypothetical RCV election scenario, to ascertain if the inclusion of partisan cues can effectively counteract biases against Black, Asian, and Indigenous candidates – applying the methodology of Crowder-Meyer et al. (2023) to the Canadian context.

In **low-information election settings** – e.g., Toronto city council elections – voters lack explicit party affiliations and detailed knowledge about candidates.<sup>4</sup>

This dearth of information biases voters' decision-making processes, leading them to **simplify complex decisions by making choices based on superficial factors** – for example, a candidate's race, gender, or ethnicity – rather than the substantive evaluation of candidates' policies.<sup>3</sup>

Crowder-Meyer et al. (2023) revealed that **BIPOC candidates** – specifically, Black, Asian, and Hispanic candidates – **consistently faced disadvantages regardless of the voting format** – highlighting the resilience of voter biases and heuristic tendencies even when partisanship information is available.<sup>2</sup> **Will Canadians behave similarly?**

## Research Questions & Hypotheses

### Research Questions:

1. How does RCV impact voter support for candidates from different racial and ethnic groups in Canada?
2. Do partisan cues mitigate biases against BIPOC/minority candidates?
3. Does political membership contribute to negative partisanship?

### Hypotheses:

- **H1:** Canadian voters are less likely to support BIPOC candidates than White candidates – consistent with voter biases found in Crowder-Meyer et al. (2023).

	Name	Rank
Candidate 1	Julie Chang	2
Candidate 2	Latoya Butler	3
Candidate 3	Wendy Burns	1
Candidate 4	Cynthia Hernandez	4

VS.

	Name	Rank
Candidate 1	Julie Chang	2
Candidate 2	Latoya Butler	3
Candidate 3	Wendy Burns	1
Candidate 4	Winona Yellowfeather	4

Figure 1. Comparison of American vs. Canadian Respondents.

- **H2:** Providing partisanship labels to voters reduces racial biases in candidate support.

	Name	Rank
Candidate 1	Julie Chang	2
Candidate 2	Latoya Butler	3
Candidate 3	Wendy Burns	1
Candidate 4	Winona Yellowfeather	4

VS.

	Name	Party	Rank
Candidate 1	Julie Chang	PPC	1
Candidate 2	Latoya Butler	Conservative	2
Candidate 3	Wendy Burns	Liberal	3
Candidate 4	Winona Yellowfeather	NDP	4

Figure 2. No-Label vs. Label Condition.

- **H3:** Conservative voters are more likely than Liberals to exhibit negative partisanship in their subsequent rankings (2<sup>nd</sup>/3<sup>rd</sup>/4<sup>th</sup>) on an RCV ballot.

Self-identified **Conservative** Voter

	Name	Party	Rank
Candidate 1	Julie Chang	NDP	3
Candidate 2	Latoya Butler	Liberal	2
Candidate 3	Wendy Burns	Conservative	1

VS.

Party	Rank
NDP	2
Liberal	3
Conservative	1

I hate liberals

- Here the voter makes **ideologically-consistent** ranking decisions.

Figure 3. Assessing Negative Partisanship.

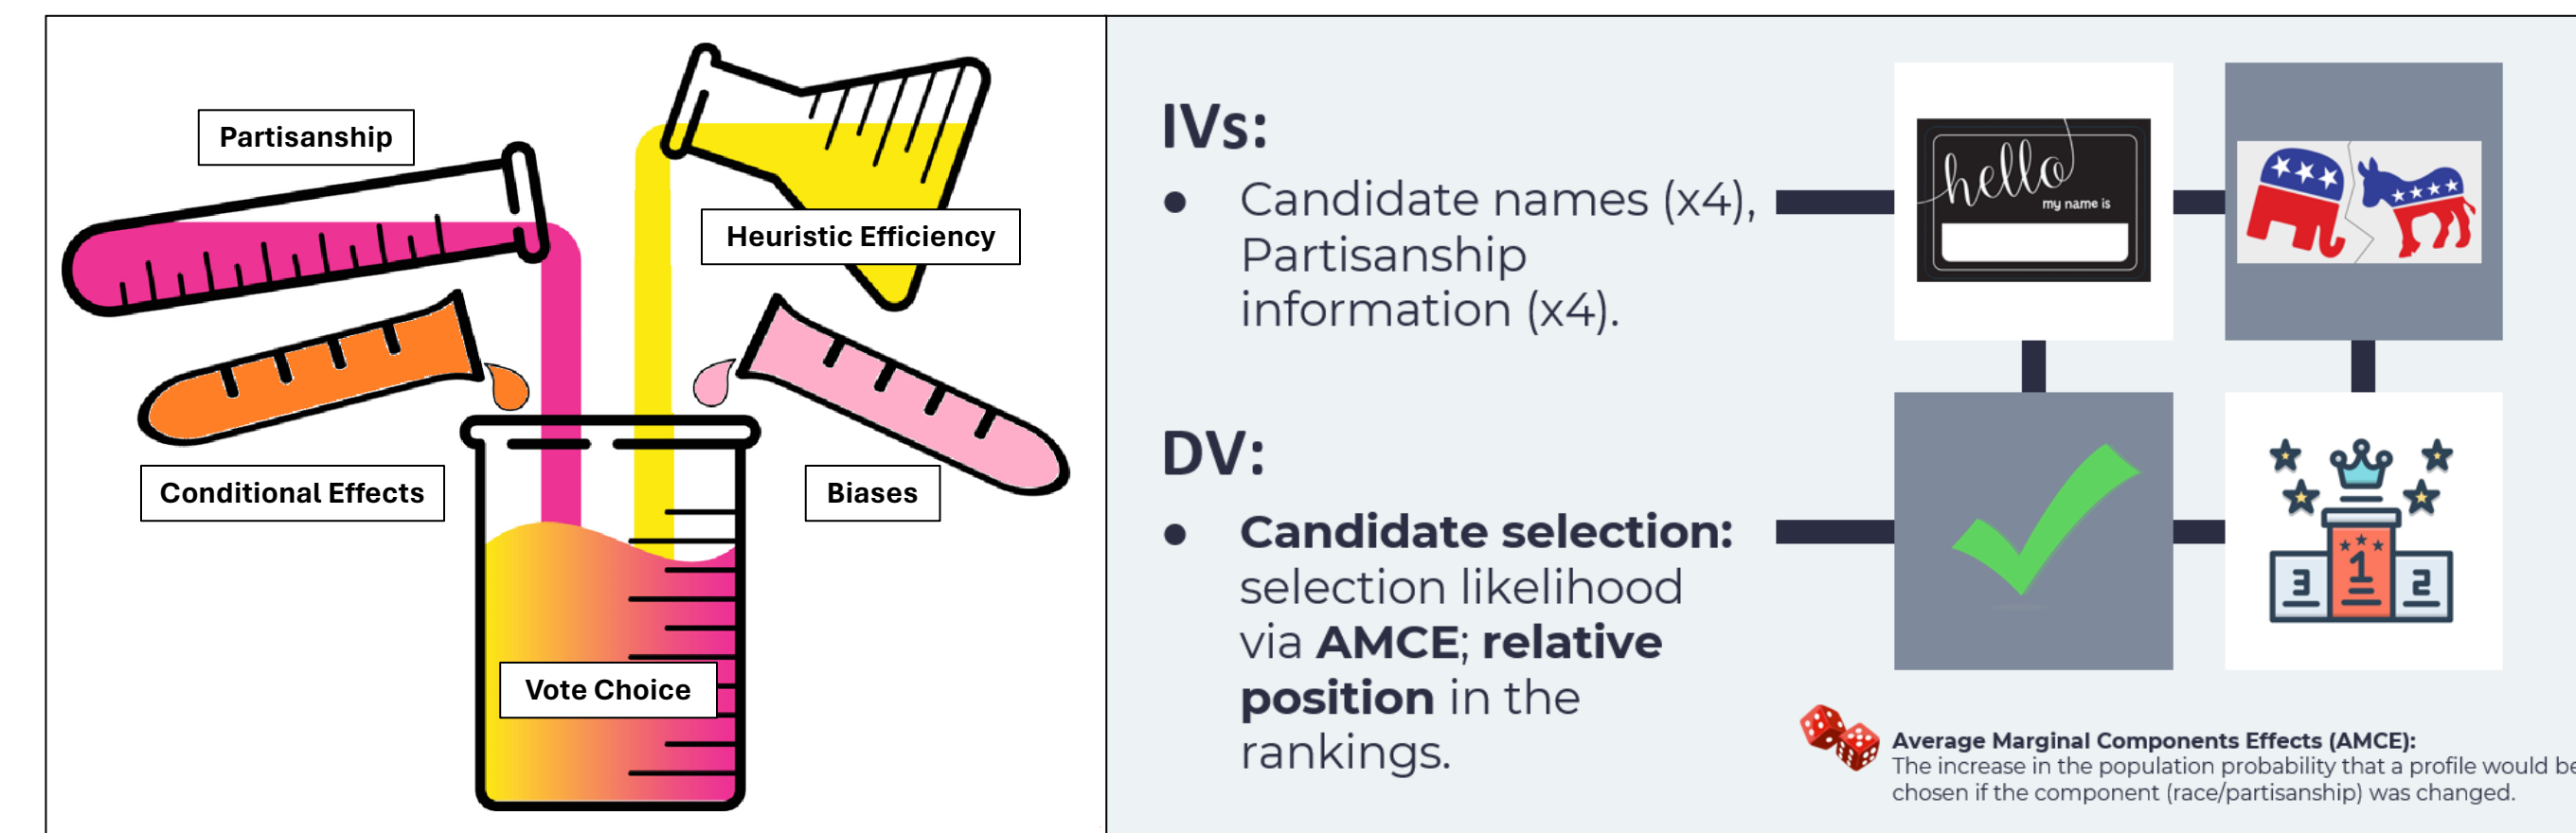

- Here the voter *forgoes* ideology via **negative partisanship**.

## Methods

### Survey Experiment: Non-probability Convenience Sample

- Voting-eligible adults ( $N = 137$ ; males = 62, females = 73, non-binary = 2)
- Ages: 18-24 (51), 25-34 (28), 35-44 (25), 45-54 (17), 55-64 (7), 65+ (6), *undisclosed* (3)

Extends key study of Crowder-Meyer et al. (2023) to Canada by adapting survey language and demographic measures from *Canadian Election Study*.

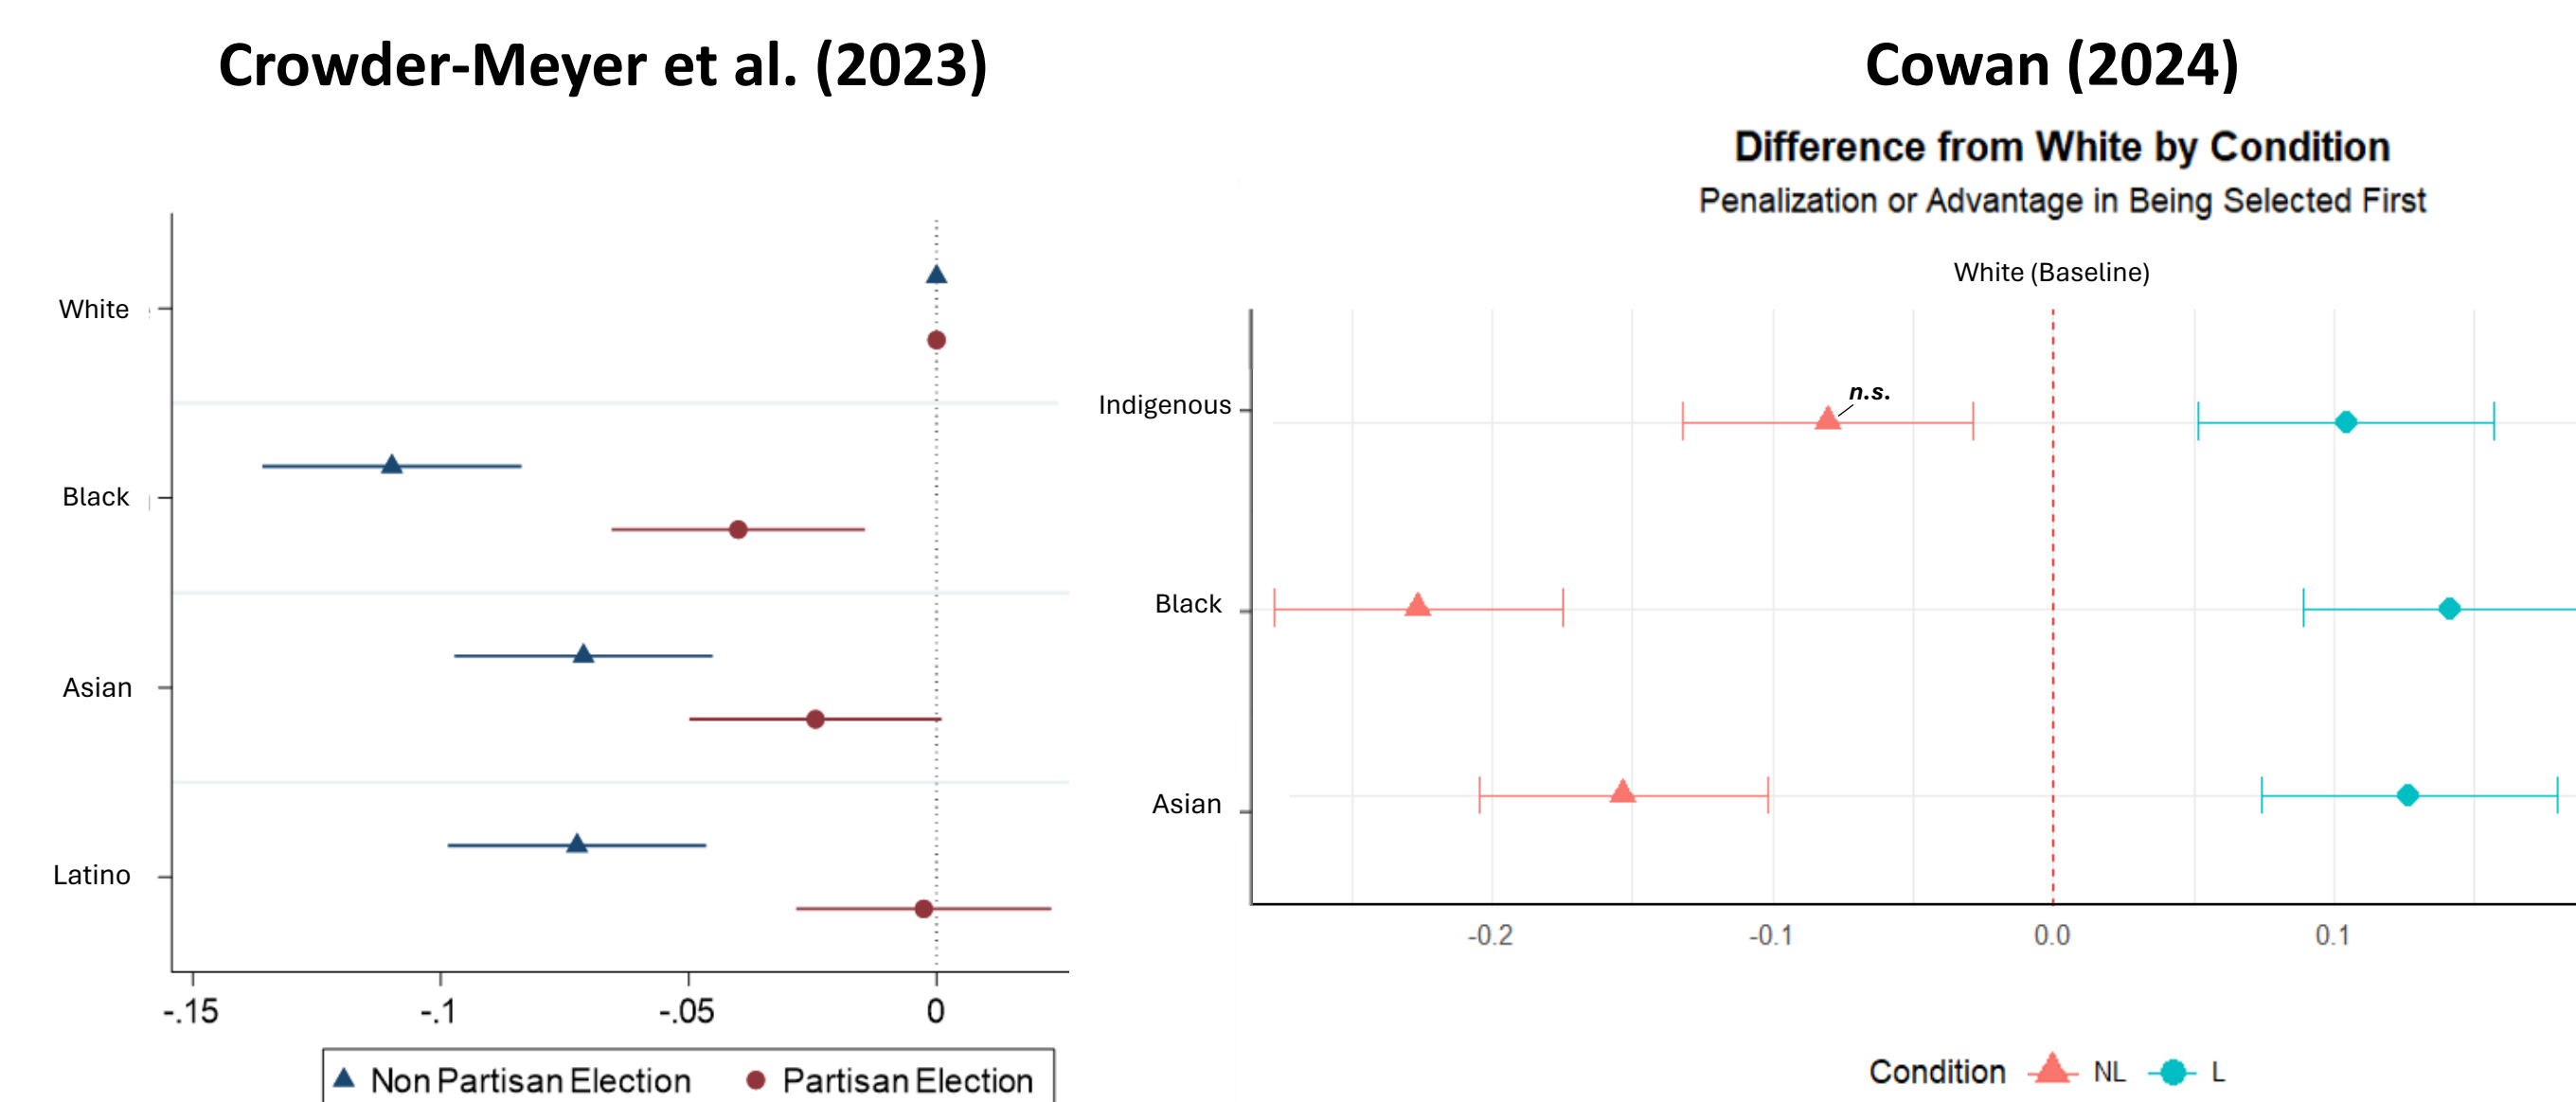

- **Short Indigenous Resentment Scale<sup>1</sup>:** series of four questions gauging resentment.

- **Online Survey via Qualtrics:** average completion time = 15 min.

## Results & Analyses

- BIPOC candidates are **penalized** in Non-Partisan elections.
- Although **party labels help**, **penalization persists**.
- Most BIPOC candidates are **penalized** in Non-Partisan elections (**H1**).
- This **penalization disappears** when party labels are introduced (**H2**).

Figure 4. Stacked Bar Chart of NL/L Rankings.

## Exploratory Analyses

### Influence of Respondent Demographics & Ideologies:

- **Affinity Voting:** Favouring candidates of a similar ethnic background.<sup>2</sup>
- Crowder-Meyer et. al (2023) found that racial bias in candidate selection was primarily driven by **white respondents with moderate to conservative ideologies**.<sup>2</sup>
- We test these findings – in the *No Label* condition – via Logistic Regression.

### Logistic Regression – No Label:

- Self-identified **White Conservative voters** were found to have **significantly higher odds of ranking White candidates as their first choice** ( $p < .01$ ).
- No significant difference was found in the odds of self-identified **Asian voters** preferring Asian candidates as their first choice ( $p = .582$ ).
- Self-identified **Black voters** were found to have **significantly higher odds of ranking Black candidates as their first choice** ( $p < .05$ ).

Ultimately, we find some evidence of Affinity Voting within our sample.

## Discussion & Limitations

### RCV Analysis – Effect size:

- Our OLS regression produced an **Adjusted R-squared of 0.0324** (unreported by original study authors).<sup>2</sup>

### (H3) Negative Partisanship:

- Demonstrated by approximately **25% of Conservative and Liberal respondents**.
- No significant difference in engaging in negative partisanship by self-identified Conservatives/Liberals.

### Small Sample Characteristics:

- Our sample did not conform to *Census Canada* demographics (e.g., age, ethnicity).

### Study Design:

- **Order-effects:** large battery of racially-charged questions appear prior to RCV trials.
- **Attrition:** 93 participants (missingness/AC failure).

Figure 5. Bar Chart of Respondent Race.

## Implications

- Our findings *speculatively* suggest that the quantity and quality of information available to voters could shape the Canadian electorate's preferences at the ballots.
- A well-funded, truly *representative* study could deepen our understanding of how racial biases and partisanship influence the election prospects of BIPOC candidates. In the interim, our replication effort serves as a proof of concept intended to spark future endeavours.
